Stand 01/2027

Information for the operation

1. The operation of the spots will be with a local anesthetic. The can raise an incompatibility or an allergic reaction. That is why it is necessary, that you wait for 10 min after the operation in our practice. The ability to drive can be limited after many local anesthetics.
2. It is seldom possible, for the operation wound to bleed more than general.

3. The wound will be stitched with a special thread, which decomposes on its own. It takes about 3 to 4 weeks. A crust on the wound is normal. In the worst case, which is very rare, a wound infection is possible.

4. A scar is unavoidable, but we try to make it small. After 2 months I will check the scar, and when if the scar is not fine, I will improve it by a special cosmetic treatment. This treatment is always free of charge. The removal of fibroms or warts cannot cause scars.
5. You will feel only a tweak, not a pain after the anesthesia.

6. We will send the operated spots for a histologic examination. We will get the result after two weeks. If it is cancer, we will phone you. Could you give us your e-mail addresse or phone number at the reception please? If it's benign, I will explain your report on the day of the scar check.

I have read the information of the operation carefully and I agree to proceed.

After surgical removal the suspected cancer tissue will be send to the histological laboratory of amedes MVZ für Laboratoriumsdiagnostik for further research. By signing below you agree and consent to this procedure.
